1 Introduction

The Introduction chapter does not contain any numerical examples demonstrating survey methodology. Before reproducing the analyses of the following chapters, we load the SDA package

> library(SDaA)

The survey package is loaded as well as it was specified as a dependency of the SDaA package.

2 Simple Probability Samples

3 Ratio and Regression Estimation

3.1 Ratio Estimation

```
> agsrsDesign <- svydesign(ids = ~1, weights = ~1,
+ data = agsrs)</pre>
```

3.2 Regression Estimation

```
> pf <- data.frame(photo = c(10, 12, 7, 13, 13, 6,
+ 17, 16, 15, 10, 14, 12, 10, 5, 12, 10, 10, 9,
+ 6, 11, 7, 9, 11, 10, 10), field = c(15, 14, 9,
+ 14, 8, 5, 18, 15, 13, 15, 11, 15, 12, 8, 13,
+ 9, 11, 12, 9, 12, 13, 11, 10, 9, 8))</pre>
```

3.3 Estimation in Domains

3.4 Models for Ratio and Regression Estimation

```
> plot(I(acres92/10^6) ~ I(acres87/10^6), xlab = "Millions of Acres Devoted to Farms + ylab = "Millions of Acres Devoted to Farms (1992)",
+ data = agsrs)
> abline(Im(I(acres92/10^6) ~ 0 + I(acres87/10^6),
+ data = agsrs), col = "red", lwd = 2)
```

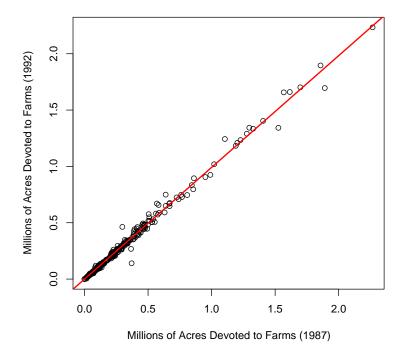

Figure 1: Figure 3.1, p. 64

> plot(y ~ x, data = seedlings, xlab = "Seedlings Alive (March 1992)",
+ ylab = "Seedlings That Survived (February 1994)")

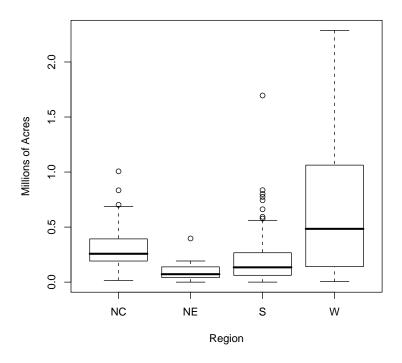

Figure 2: Figure 3.4, p. 73

Residuals:

Min 1Q Median 3Q Max -369.878 -22.090 -5.736 10.764 311.713

Coefficients:

Estimate Std. Error t value Pr(>|t|)
acres87 0.986565 0.004844 203.7 <2e-16 ***
--Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1

Residual standard error: 46.1 on 298 degrees of freedom

```
> wtresid <- resid(model1)/sqrt(agsrs$acres87)
> plot(wtresid ~ I(agsrs$acres87/10^6), xlab = "Millions of Acres Devoted to Farms (19)
+ ylab = "Weighted Residuals")
```

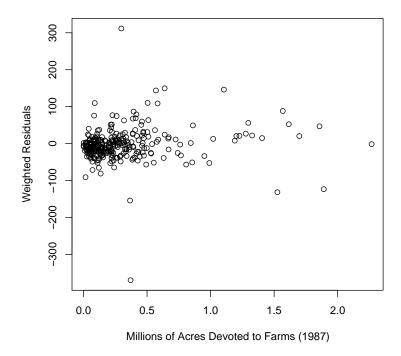

Figure 3: Figure 3.6, p. 85

Multiple R-squared: 0.9929, Adjusted R-squared: 0.9928 F-statistic: 4.149e+04 on 1 and 298 DF, p-value: < 2.2e-16

4 Stratified Sampling

> boxplot(acres92/10^6 ~ region, xlab = "Region", ylab = "Millions of Acres",
+ data = agstrat)

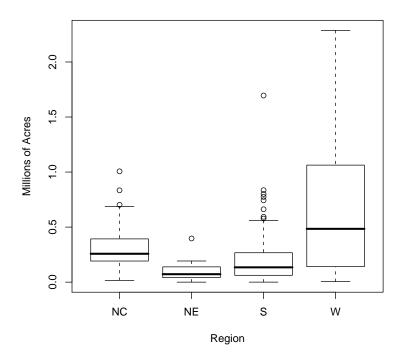

Figure 4: Figure 4.1, p. 97

5 Cluster Sampling with Equal Probabilities

5.1 Notation for Cluster Sampling

No analyses contained in this section.

5.2 One-Stage Cluster Sampling

```
> GPA <- cbind(expand.grid(1:4, 1:5), gpa = c(3.08,
```

2.6, 3.44, 3.04, 2.36, 3.04, 3.28, 2.68, 2, 2.56,

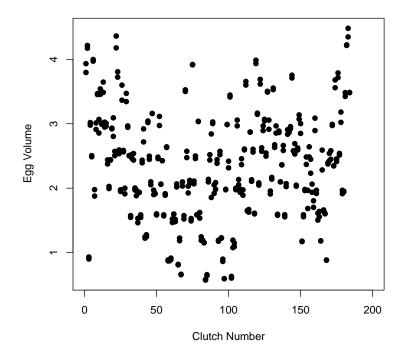

+ 2.52, 1.88, 3, 2.88, 3.44, 3.64, 2.68, 1.92,

```
+ 3.28, 3.2))
> names(GPA)[1:2] <- c("person_num", "cluster")
> GPA$pwt <- 100/5
> clusterDesign <- svydesign(ids = ~cluster, weights = ~pwt,
+ data = GPA)
> svytotal(~gpa, design = clusterDesign)

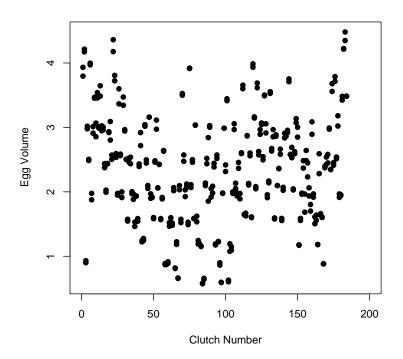

total SE
gpa 1130.4 67.167
```

5.3 Two-Stage Cluster Sampling

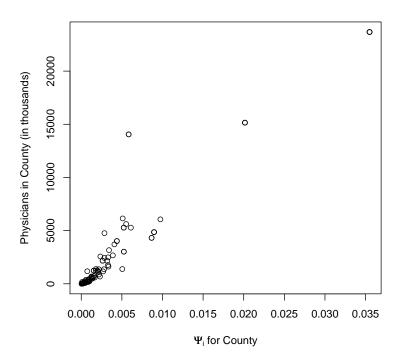

```
> plot(volume ~ clutch, xlim = c(0, 200), pch = 19,
+ data = coots, xlab = "Clutch Number", ylab = "Egg Volume")
```

```
> plot(volume \tilde{} clutch, xlim = c(0, 200), pch = 19,
+ data = coots, xlab = "Clutch Number", ylab = "Egg Volume")
```

6 Sampling with Unequal Probabilities

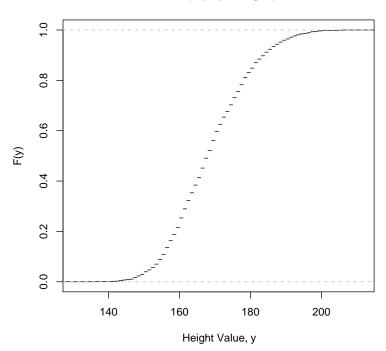

7 Complex Surveys

7.1 Estimating a Distribution Function

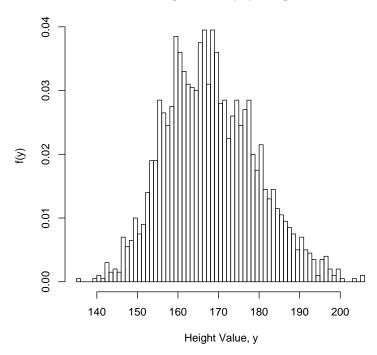

```
> data(htpop)
```

- > popecdf <- ecdf(htpop\$height)</pre>
- > plot(popecdf, do.points = FALSE, ylab = "F(y)", xlab = "Height Value, y")

ecdf(htpop\$height)

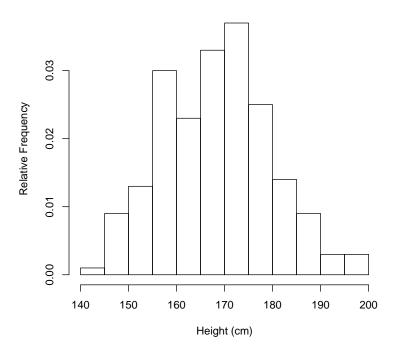

```
> data(htsrs)
```

> hist(htsrs\$height, ylab = "Relative Frequency", xlab = "Height (cm)",

+ freq = FALSE)

13

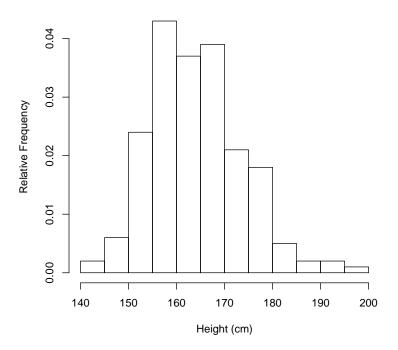

Histogram of htsrs\$height

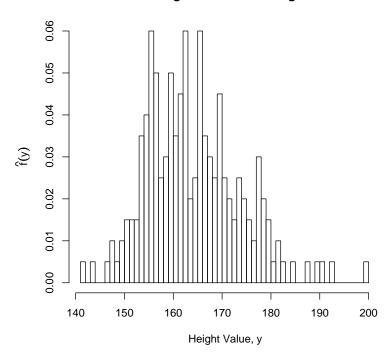

```
> data(htstrat)
```

- > hist(htstrat\$height, ylab = "Relative Frequency",
- + xlab = "Height (cm)", freq = FALSE)

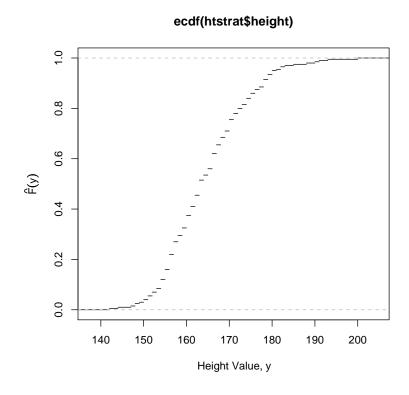

Histogram of htstrat\$height

Histogram of htstrat\$height

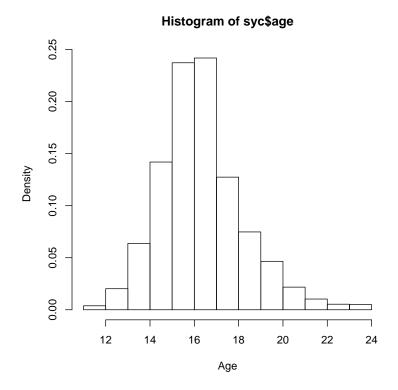

```
> stratecdf <- ecdf(htstrat$height)
> plot(stratecdf, do.points = FALSE, ylab = expression(hat(F)(y)),
+ xlab = "Height Value, y")
```

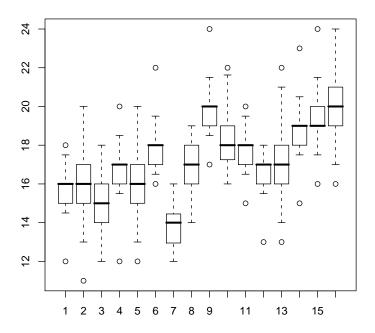

7.2 Plotting Data from a Complex Survey

- > data(syc)
- > hist(syc\$age, freq = FALSE, xlab = "Age")

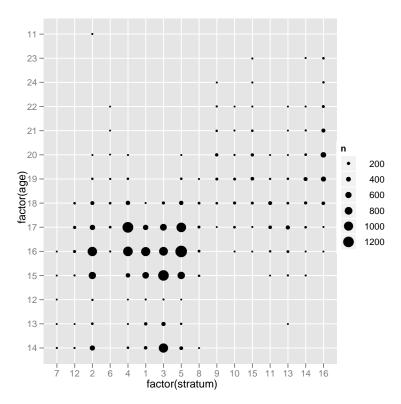

Note that in its current implementation, svyboxplot will only plot minimum and maximum as outliers if they are situated outside the whiskers. Other outliers are not plotted (see ?svyboxplot). This explains the minor difference with Figure 7.8 on p. 237 of Lohr (1999).

```
> sycdesign <- svydesign(ids = ~psu, strata = ~stratum,
+          data = syc, weights = ~finalwt)
> oo <- options(survey.lonely.psu = "certainty")
> svyboxplot(age ~ factor(stratum), design = sycdesign)
> options(oo)
```

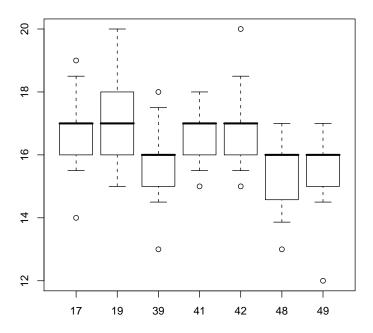

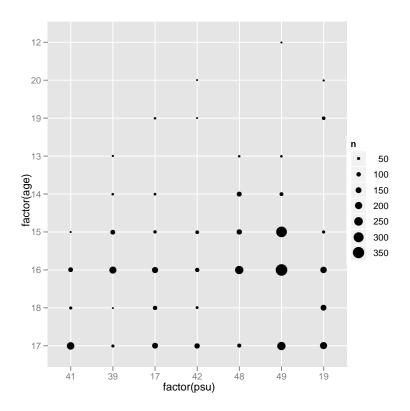

This kind of plot is particularly easy to formulate in the grammar of graphics, i.e. using the <code>ggplot2</code> package :

Note that in its current implementation, svyboxplot will only plot minimum and maximum as outliers if they are situated outside the whiskers. Other outliers are not plotted (see ?svyboxplot). This explains the minor difference with Figure 7.10 on p. 238 of Lohr (1999).

```
> oo <- options(survey.lonely.psu = "certainty")
> sycstrat5 <- subset(sycdesign, stratum == 5)
> svyboxplot(age ~ factor(psu), design = sycstrat5)
> options(oo)
```
